ZERO-NET EMISSIONS BY 2050: CLIMATE REALITIES AND CHALLENGES

KARL HAUSKER, PH.D.
SENIOR FELLOW
[KHAUSKER@WRI.ORG](mailto:khausker@wri.org)

OCTOBER 2019

OUTLINE

- The mitigation challenge: the IPCC perspective
- Four strategies to reach zero net carbon
- The renewables revolution
 - how far can wind and solar take us?
- The need to “spread our chips”
 - roles for nuclear and CCS
- The imperative of carbon dioxide removal
- Key messages

- *Speed limit, weblinks, Q&A*

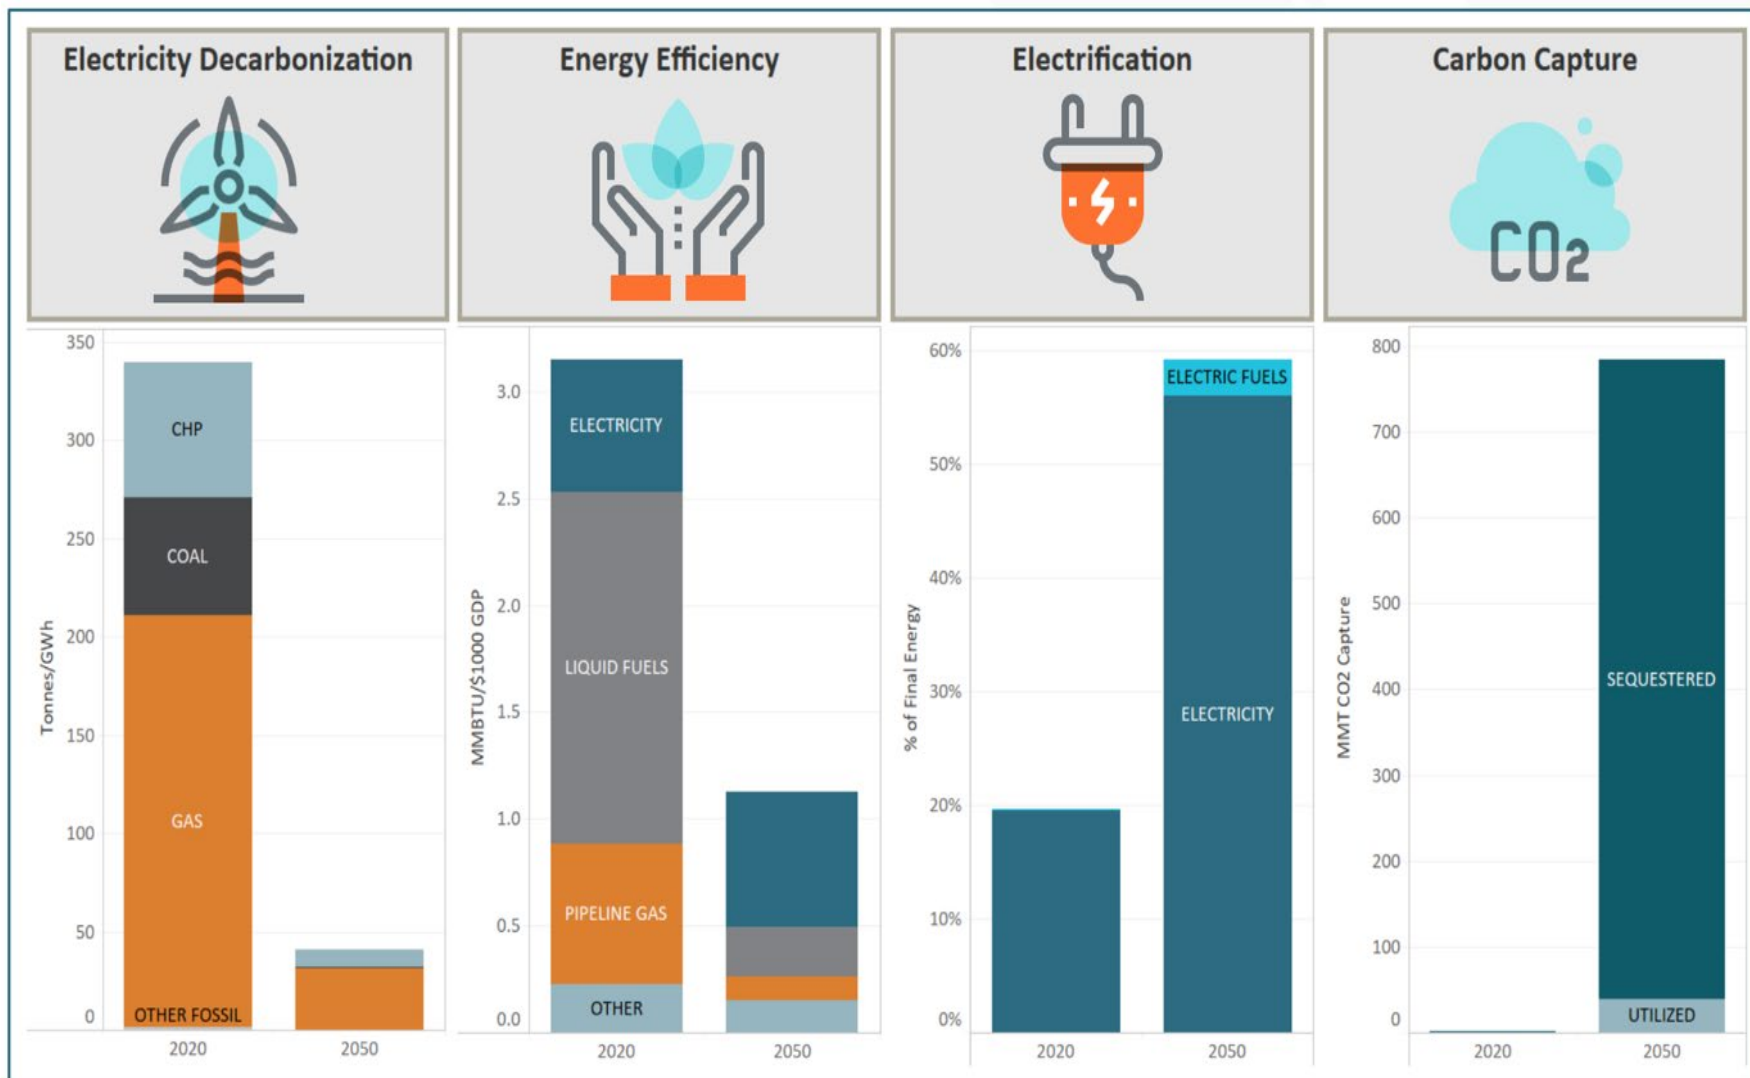

IPCC REPORT RELEASED IN OCT. 2018 LAYS OUT GLOBAL PATHWAYS TO A SAFE CLIMATE

1.5°C PATHWAYS REQUIRE NET-ZERO BY MID-CENTURY

FOUR STRATEGIES TO TRANSFORM THE ENERGY SYSTEM TO ZERO-CARBON

THE RENEWABLES REVOLUTION

Dramatic cost decreases in wind and solar PV over the past 10 years

LCOE: Wind: 3 – 6 cents/kWh. Solar PV: 4 – 5 cents/kWh (Utility-Scale).

EMBRACING 100% RENEWABLES

100% IN 139 COUNTRIES

Transition to 100% wind, water, and solar (WWS) for all purposes
(electricity, transportation, heating/cooling, industry)

UCS REPORT CITES VALUE OF EXISTING NUCLEAR PLANTS

- Without policies to replace retired nuclear power generation with low-carbon energy technologies, utilities could turn to natural gas and coal to fill the gap
 - could result in a 4 to 6 percent increase in US power sector emissions.

SMALL MODULAR REACTORS HOLD PROMISE

The Nuclear Power Dilemma

Declining Profits, Plant Closures, and the Threat of Rising Carbon Emissions

BACKGROUND

Many nuclear power plants have also been in recent years due to economic, safety, and performance challenges. Without policies to replace retired nuclear power generation with low-carbon energy technologies, utilities could turn to natural gas and coal to fill the gap. Anticipating an ability to reduce their operating emissions in the long run, utilities have the most impact of global warming.

To help the electricity sector continue its transition to cleaner energy sources, federal and state policies must provide utility the ability to recoup at least some of the costs of these investments. At the same time, any financial support required specifically for existing nuclear plants must be coupled with strong consumer protection, stringent safety requirements, and investments in research and energy efficiency.

For decades, nuclear power has provided most of the nation's carbon-free electricity. However, the industry has shut down many nuclear plants in the last few years as retirement plans to close them well before their operating licenses expire, generating a low-carbon energy policy vacuum and increasing the impact of early retirement. The primary reasons for these early closures are the economic challenges brought on by cheap natural gas, diminished demand for electricity, falling costs for renewable energy, rising operating costs, and safety and performance problems. The possibility that the nation will replace existing nuclear plants with natural gas and coal rather than low-carbon sources raises serious concerns about our ability to achieve the deep cuts in carbon emissions needed to limit the worst impacts of climate change.

As of the end of 2013, 94 reactors at 61 power plants provided 20 percent of U.S. electricity generation. The industry has retired six reactors at five plants since 2010, closed seven reactors at five more plants in 2014, and plans to close eight more, and threatened to close five reactors at four more plants in the next few years if they do not receive new financial support. In addition, Illinois, New Jersey, and New York have generally financial support to keep its reactors at seven plants operating for at least 40 more years.

The economic challenges facing nuclear plants are part of a historic transition in the U.S. electricity sector. Over the last decade, natural gas generation and renewable energy generation from wind and solar have grown rapidly on their own.

BRIEF

Big milestone for a small reactor: NRC completes next phases of NuScale review

CARBON CAPTURE AND STORAGE WORKS

COSTS WILL DECREASE WITH INNOVATION AND SCALE

CARBON CAPTURE MUST BE FULLY COMMERCIALIZED CRITICAL FOR INDUSTRY AND FOR CARBON DIOXIDE REMOVAL

Global total net CO₂ emissions

Billion tonnes of CO₂/yr

CARBON DIOXIDE REMOVAL TECHNIQUES

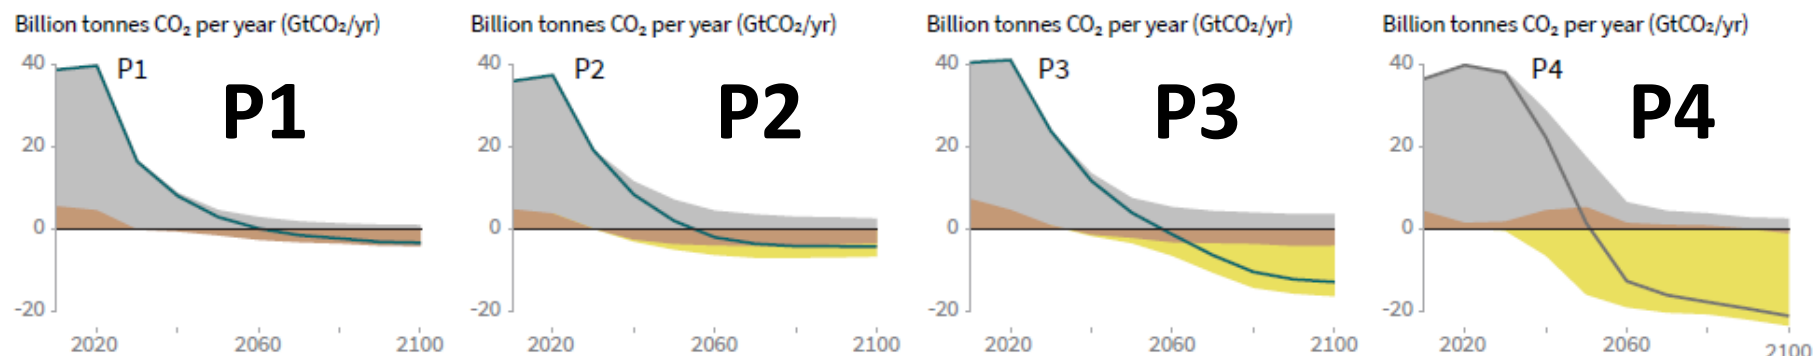

Also at research stage: Enhanced weathering of rocks/minerals, and seawater capture

FOUR ILLUSTRATIVE PATHWAYS – ROLE OF CDR

- Carbon dioxide removal (CDR) needed via AFOLU (Agriculture, Forestry, Other Land Use), BECCS (Bioenergy with CCS), and/or other technologies and processes (e.g. DACS (Direct Air Capture and Storage))
- P1, P2 and P3: “no or limited overshoot” P4: “high overshoot”

Breakdown of contributions to global net CO₂ emissions in four illustrative model pathways

● Fossil fuel and industry ● AFOLU ● BECCS

P1: A scenario in which social, business, and technological innovations result in lower energy demand up to 2050 while living standards rise, especially in the global South. A down-sized energy system enables rapid decarbonisation of energy supply. Afforestation is the only CDR option considered; neither fossil fuels with CCS nor BECCS are used.

P2: A scenario with a broad focus on sustainability including energy intensity, human development, economic convergence and international cooperation, as well as shifts towards sustainable and healthy consumption patterns, low-carbon technology innovation, and well-managed land systems with limited societal acceptability for BECCS.

P3: A middle-of-the-road scenario in which societal as well as technological development follows historical patterns. Emissions reductions are mainly achieved by changing the way in which energy and products are produced, and to a lesser degree by reductions in demand.

P4: A resource and energy-intensive scenario in which economic growth and globalization lead to widespread adoption of greenhouse-gas intensive lifestyles, including high demand for transportation fuels and livestock products. Emissions reductions are mainly achieved through technological means, making strong use of CDR through the deployment of BECCS.

EXAMPLES OF FEDERAL AND STATE GOALS: 100% RENEWABLE VS 100% CLEAN (WITH RPS BOOST...)

	100% Renewable	100% Clean (zero carbon)
Federal	<ul style="list-style-type: none"> • <i>By 2035: Climate Solutions Act, H.R. 330 (Lieu), 2019.</i> • <i>By 2050: “100% Renewable” - Sanders</i> 	<ul style="list-style-type: none"> • <i>By 2030: Green New Deal Resolution, (AOC-Markey)2019.</i> • <i>By 2050: Clean Energy Standard Act (Smith/Lujan), 2019.</i>
State	<ul style="list-style-type: none"> • By 2045: Hawaii, H.B. 623, 2015. • By 2050: Puerto Rico, P.S. 1121, 2019. • By 2032: District of Columbia, Clean Energy DC Omnibus Act, 2018 • <i>By 2040: Colorado, Governor’s proposal for 100% renewable electricity.</i> 	<ul style="list-style-type: none"> • By 2045: California S.B.100, 2018. • By 2045: New Mexico S.B. 489, 2019. • By 2045: Washington S.B. 5116, 2019 • By 2050: Nevada S.B. 358, 2019 • <i>By 2040: New York, Governor’s Green New Deal proposal, 2019.</i> • <i>By 2050: New Jersey, Governor’s E.O. #28 on Energy Master Plan</i> • <i>By 2050: Campaign commitments from governors in CT, IL, ME, MI, WI.</i>

Black = enacted
Blue = proposed

KEY MESSAGES

- 100% renewables vs. 100% clean energy
 - 100% RE for corporate/city/other buyers is OK – an incremental boost to demand for RE – but should evolve to 100% CE
 - 100% RE requirement for a state or country poses challenges in terms of performance, reliability, cost.
 - A broad portfolio of zero-carbon electricity options is valuable from cost and risk management perspectives (*“spread your chips”*).
 - CCS for carbon dioxide removal is critical to meeting 1.5 or 2 degree goals. CCS must be fully commercialized in the 2020s.
- Importance of RD&D programs with a broad portfolio.
- An expanded transmission system is critical in any scenario.
- Role of existing nuclear plants (*UCS report, Nov. 2018*)
- Global perspectives – food for thought...
 - Nuclear power
 - CCS
